

## **Practical 1**

### **Aim: Introduction to Web Technologies**

#### **What is web technology?**

Web technology refers to the means by which computers communicate with each other using markup languages and multimedia packages. It gives us a way to interact with hosted information, like websites. Web technology involves the use of hypertext markup language (HTML) and cascading style sheets (CSS).

#### **Browser**

To view the Internet most people use a browser. Some widely used examples include Chrome and Firefox. Web browsers work by connecting over the Internet via modem or ISDN via a server or ISP to remote machines, asking for a particular document (or page) and then formatting the documents they receive for viewing on a computer.

#### **HTTP**

To do this, web browsers use a special language called HTTP (HyperText Transfer Protocol). The remote machines containing the documents run HTTP servers. When an HTTP server receives a request for a page, it sends it back to the local computer for viewing through the browser.

#### **URL**

Each document on the Web has a particular URL (Uniform Resource Locator). This tells the browser which server to go to to get the document. The syntax of the URL is simple to understand. The HTTP signifies that the language to be used is HyperText Transfer Protocol. The host name is the name of the server. For example, <http://www.google.com> would look for the Google server. The path is the document requested from the server. This is not the same as the file system path; the server defines its root.

#### **HTML**

HTML 4.0 is the most recent and widely accepted version of HTML and includes what are called Cascading Style Sheets (CSS). CSS allows web developers to specify many of the repeated style characteristics (e.g. font, colour, and spacing) with a particular piece of HTML code (called a tag). This enables a quick, but consistent, look throughout the site. An organisation called the World Wide Web Consortium (W3C) develops HTML standards to ensure that they are uniform across the world.

HTML is made up of text, which is the content of any web page, and tags, which define the appearance and layout of that page. HTML is simply text with an outer <html> tag at the start and end of the document.

Related to HTML, is XML (Extensible Mark-up Language.) XML is a meta-language that allows you to develop your own document tags.

Due to the increasing demands for entertainment by the web community, several languages have sprung up which allow users to bring animation and dynamism to their pages. These include CGI, JavaScript and PHP.

### **JavaScript**

JavaScript is an object-based scripting language. It is embedded in the latest versions of the popular browsers and allows executables to run from the browser. This means that rather than waiting for an animated page to download from the server, the animation can run from your browser, creating dynamic HTML content. JavaScript works with your browser to detect and react to instructions that happen as a document is being loaded, rendered and used. These are signified within HTML as `<script>` tag.

### **PHP**

Unlike JavaScript, which is a client-side language, PHP is a server-sided cross platform scripting language. It is a way to put instructions in your HTML files to create dynamic content. Your web server then follows these instructions. This happens before the page appears on your browser. The web server sends the PHP code with the content that the code was written to produce.

### **TCP/IP**

In between a PC accessing the Internet (generally referred to as the "client") and the server, is the network. The network uses Transmission Control Protocol (TCP) and Internet Protocol (IP) to transmit the data and find the relevant servers and clients. Clients and servers also use HTTP.

TCP and IP are both protocols. A protocol is a set of rules that govern the way two or more computers communicate with one another. Protocols have a dual existence. First, they are a text form for programmers to understand and can be used to develop communication between computers. Secondly, they exist as a code that only computers understand. Both forms have the ultimate purpose of specifying the precise interpretation of every part of every message exchanged across the Web or network.

We use protocols every time we need to communicate with another computer. If you use a networked printer, you will have used protocols to print this document. If you saved your work on a networked drive, you are using protocols.

TCP is a connection-oriented transport protocol that sends data as an unstructured stream of bytes. By using sequence numbers and acknowledgment messages, TCP can provide a sending node with delivery information about packets transmitted to a destination node. Where data loss occurs in transit, TCP can re-submit the data until it is successfully delivered or the operation times out. TCP can also discern multiple identical messages and discard them. TCP can monitor the flow of data from the sending computer and slow it down, as required, to avoid data loss.

IP (Internet Protocol) describes how servers recognise each other. IP transmits what are called datagrams over the network and reports errors in transmission. IP is responsible for fragmentation and re-assembling data with different maximum data unit sizes using IP

addresses, globally unique 32-bit numbers that identify a particular server. These addresses are assigned by the Network Information Centre. Their uniqueness ensures that any IP Network can communicate with another, just by knowing its IP address.

## Practical 2

**AIM: Write Html code to demonstrate the following tags w.r.t Panjab University Web Application and Online Library**

**#basic html tags <!doctype> <html> <title> <body> <h1>to <h6> <p>  
<br> <hr>  
#formatting tags <b> <i> <em> <font> <pre> <small> <strong> <sub>  
<sup> (font em tag missing)**

Code :

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <title>Welcome To Panjab University</title>
    <meta charset="UTF-8">

</div>
</body>
</html>
```

## **Practical 4**

**AIM: Write a program w.r.t to Panjab University Web Application and Online Library that implements  
Forms <form> <input><textarea><button><option><label>**

Code :

```
<!DOCTYPE html>
<html>
<body>

<h2>Book searching corner</h2>

<form action="/action_page.php">
  Book Name:<br>
  <input type="text" name="bookname" value="">
  <br>
  Author name:<br>
  <input type="text" name="authorname" value="">
  <br><br>
  <input type="submit" value="Submit">
</form>

<p>If you click the "Submit" button, the form-data will be sent to a page called
"/action_page.php".</p>

</body>
</html>
```

## **Practical 5**

**AIM: Use internal style sheets to demonstrate the following:**

**CSS Colors**

**CSS backgrounds**

**CSS margins**

**CSS margins**

**CSS padding**

**CSS height/width**

**css text**

**CSS fonts**

**CSS links**

**CSS lists**

- **CSS tables**

Code :

```
<!DOCTYPE HTML>
```

```
<html lang="en">
```

```
<style>
```

```
* {
```

```
    margin: 0;
```

```
    padding: 0;
```

```
    box-sizing: border-box;
```

```
    text-rendering: optimizeLegibility;
```

```
}
```

```
div.container {
```

```
width: 100%;
}

header, footer {
    font-size: 30px;
    color: cyan;
    background-color: black;
    clear: left;
    text-align: center;
}

nav {
    float: left;
    width: 24%;
    height: 100%;
    margin: 0;
    padding: 10px 50px;
    border: 1px solid gray;
}

article {
    float: right;
    padding: 1em;
    width: 75%;
}

.tri{
    border-top: 1px solid gray;
    padding: 2px;
    float: left;
    width: 5%;
    height: 8%;
    margin-left: 5%;
}

.topresults {
    border-top: 1px solid gray;
    width: 70%;
    padding-left: 2em;
    padding-top: 3%;
    padding-bottom: 3%;
    margin-left: 10%;
    text-align: left;
}

</style>
```

```
<head>
  <title>Digital Library</title>
</head>

<body>
  <div class="container">
    <header style="padding: 1em">Digital Library</header>
    <nav >
      <ul>
        <li><a href="#">Books</a></li>
        <li><a href="#">Research Papers</a></li>
        <li><a href="#">Cources</a></li>
      </ul>
    </nav>

    <article align='center' >
      <form style="font-size:110%">

article {
  float: right;
  padding: 1em;
  width: 75%;
}
div > img{

  display: inline-block;
  border-top: 1px solid gray;
  padding: 2px;
  float: left;
  width: 5%;
  height:8%;
  margin-left: 5%;
}
div > p {
  border-top: 1px solid gray;
  width: 70%;
  padding-left: 2em;
  padding-top:3%;
  padding-bottom: 3%;
  margin-left: 10%;
  text-align: left;
}
```

## **Practical 7**

**AIM:WAP to enter a year and check if it is a leap year or not**

```
<html>

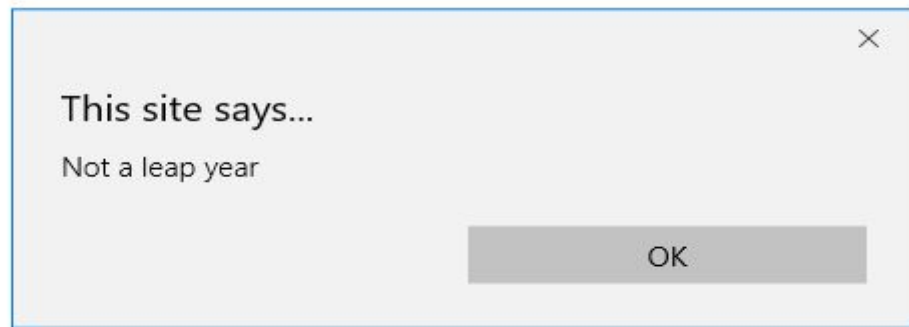

<head>
  <script>
    function verify() {
      var no;
      no = Number(document.getElementById("year").value);
      if (no % 4 == 0)
        {
          alert("leap year ");
        } else {
          alert("Not a leap year");
        }
    }
  </script>
</head>
```

```
<body>  
  Enter year:<input id="year"><br />  
  <button onclick="verify()">Click me</button>  
</body>  
  
</html>
```

### Input:

### Output:

## Practical 8

**AIM:WAP to enter a year and see if it is a leap century or not()**

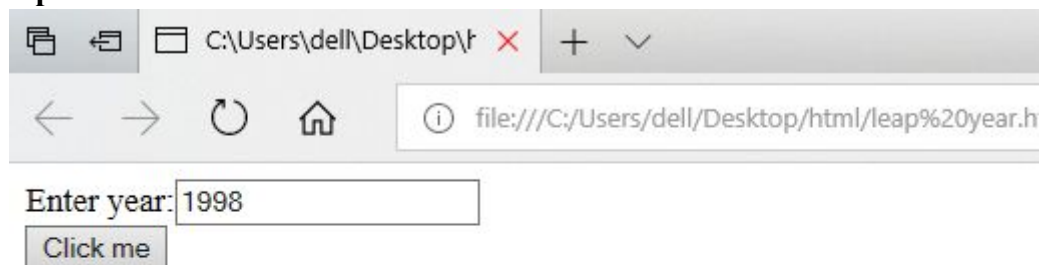

```
<html>

<head>
  <script>
    function verify() {
      var no;
      no = Number(document.getElementById("year").value);
      if (no % 4 == 0 && no % 100 == 0) {
        alert("leap year ");
      } else {
        alert("Not a leap year");
      }
    }
  </script>
</head>

<body>
  Enter year:<input id="year"><br />
  <button onclick="verify()">Click me</button>
</body>

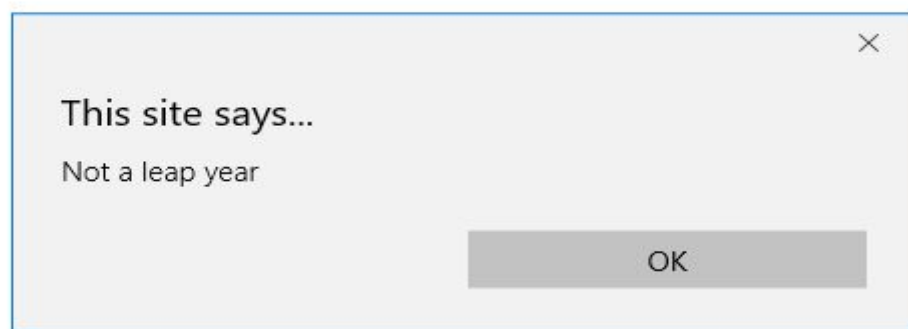

</html>
```

**Input:**

The screenshot shows a web browser window with the address bar displaying the file path: file:///C:/Users/dell/Desktop/html/leap%20year.h. Below the address bar, the page content shows the text "Enter year:" followed by an input field containing the value "1998". Below the input field is a button labeled "Click me".

**Output:**

## Practical 9

**AIM:WAP to print the largest of the three numbers**

```
<html>

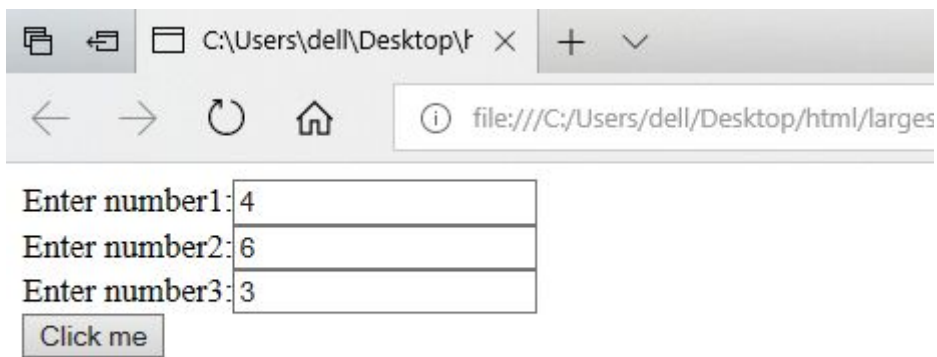

<head>
  <script>
    function verify() {
      var no1;
      no1 = Number(document.getElementById("num1").value);
      var no2;
      no2 = Number(document.getElementById("num2").value);
      var no3;
      no3 = Number(document.getElementById("num3").value);
      if (no1 >> no2 && no1 >> no3) {
        alert("larger is ." + no1);
      } else if (no2 >> no1 && no2 >> no3) {
        alert("larger is ." + no2);
      } else {
        alert("larger is ." + no3)
      }
    }
  </script>
</head>

<body>
  Enter number1:<input id="num1"><br /> Enter number2:<input id="num2"><br />
  Enter number3:<input id="num3"><br />
  <button onclick="verify()">Click me</button>
</body>

</html>
```

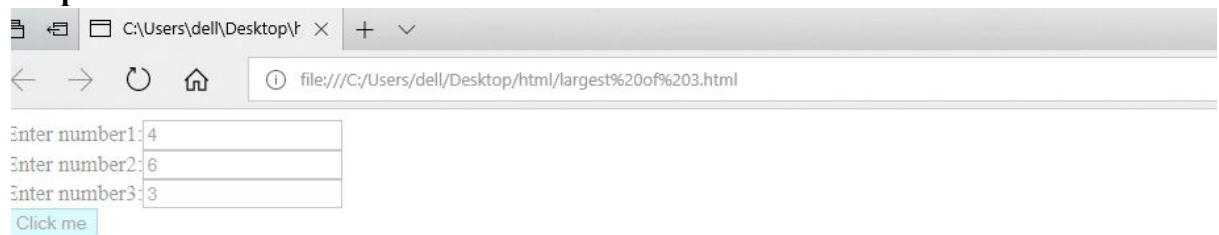

**Input:**

A screenshot of a web browser window. The address bar shows the file path: file:///C:/Users/dell/Desktop/html/larges. The page content includes three input fields with labels "Enter number1:", "Enter number2:", and "Enter number3:". The values entered are 4, 6, and 3 respectively. Below the input fields is a button labeled "Click me".

### Output:

A screenshot of the same web browser window after clicking the "Click me" button. The address bar now shows the file path: file:///C:/Users/dell/Desktop/html/largest%20of%203.html. The form content remains the same, but the "Click me" button is now highlighted in light blue.

## **Practical 10**

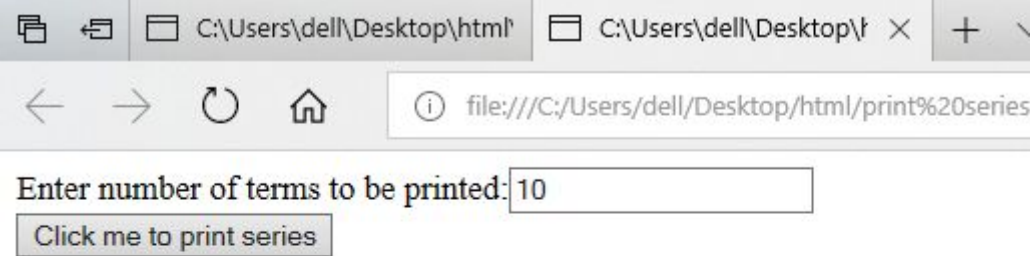

**AIM:WAP to print the following series:**

```
<html>

<head>
  <script lang="javascript">
    function series() {
      var number;
      number = Number(document.getElementById("num1").value);
      var i = 1;
      document.write(i);
      while (i < (number - 1)) {
        i = i + 1;
        document.write(" - " + i);
        i = i + 1;
        document.write(" + " + i);
      }
    }
  </script>
</head>
<body>
  Enter number of terms to be printed:<input id="num1"><br />
  <button onclick="series()">Click me to print series</button>
</body>

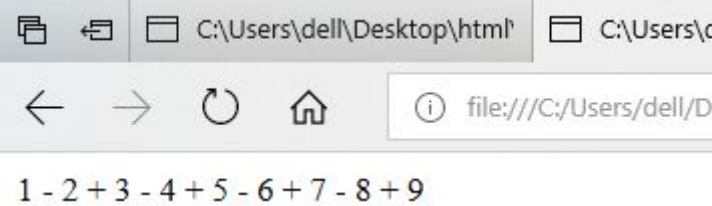

</html>
```

**Input:**

A screenshot of a web browser window. The address bar shows the file path: `file:///C:/Users/dell/Desktop/html/print%20series.`. Below the address bar, there is a text input field with the label "Enter number of terms to be printed:" and the value "10". Below the input field is a button labeled "Click me to print series".

**Output:**

A screenshot of a web browser window showing the output of the program. The address bar shows the file path: `file:///C:/Users/dell/D`. Below the address bar, the output is displayed as: `1 - 2 + 3 - 4 + 5 - 6 + 7 - 8 + 9`.

## **Practical 11**

**AIM:WAP to print sum of odd numbers**

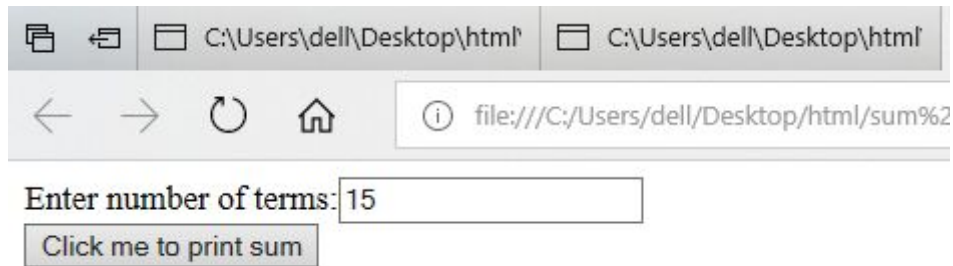

```
<html>

<head>
  <script lang="javascript">
    function series() {
      var number;
      number = Number(document.getElementById("num1").value);
      var i = 1;
      var sum = 0;
      do {
        sum = sum + i;
        i = i + 2;
      } while (i < (number - 1))
      alert("sum is: " + sum);
    }
  </script>
</head>

<body>
  Enter number of terms:<input id="num1"><br />
  <button onclick="series()">Click me to print sum</button>
</body>
```

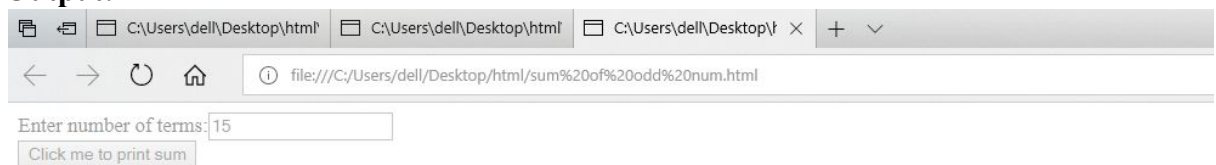

</html>

### Input:

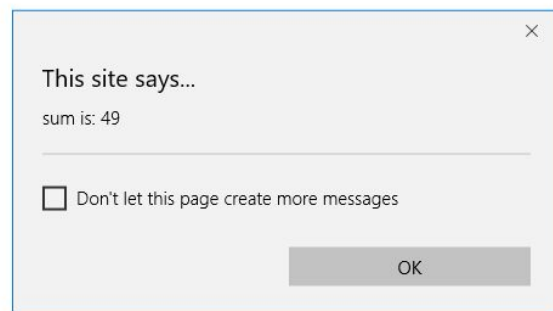

A screenshot of a web browser window. The address bar shows the file path: file:///C:/Users/dell/Desktop/html/sum%2. Below the address bar, there is a text input field labeled "Enter number of terms:" with the value "15" entered. Below the input field is a button labeled "Click me to print sum".

### Output:

A screenshot of a web browser window. The address bar shows the file path: file:///C:/Users/dell/Desktop/html/sum%20of%20odd%20num.html. Below the address bar, there is a text input field labeled "Enter number of terms:" with the value "15" entered. Below the input field is a button labeled "Click me to print sum".

## **Practical 12**

### **AIM:WAP to use break and continue**

#### **Break**

Break is for breaking the control of the loop at pre mature stage

```
for (i =1; i<=5; i++)  
{document. write (“hello”);  
If (i==2)  
{break;  
}  
}  
for (i=2; i<=n-1; i++)  
{if (n%i ==0)  
{document.write(“not prime”);  
break;}  
else  
{document.write (“prime”);  
}  
}
```

#### **Continue**

Continue will continue the control and sends the control immediately upside for next increment and skips the lower statements.

```
for (i=1; i<=5; i++)  
{  
document.write (" hello);  
if(i==2)  
{continue;}  
document.write("bye");  
}
```

### **Break**

<html>

<head>

<script>

function verify() {

var n;

n = Number(document.getElementById("year").value);

for (i = 2; i <= n - 1; i++) {

if (n % i == 0) {

document.write("not prime");

break;

} else {

document.write("prime");

break;

}

}

}

</script>

</head>

<body>

Enter number:<input id="year"><br />

<button onclick="verify()">Click me</button>

</body>

</html>

<html>

### **Continue**

<head>

<script>

function verify() {

for (i=1; i<=5; i++)

{

document.write (" hello);

if(i==2)

{continue;}  
document.write("bye");

}

```
    }  
  }  
</script>  
</head>  
  
<body>  
</body>  
  
</html>
```

## **Practical 13**

**AIM:WAP to find sum of two numbers using functions**

```
<!DOCTYPE html>  
<html>
```

```
<body>
```

```
  Number 1: <input type="number" id="myNumber1" value=" "> Number 2: <input  
  type="number" id="myNumber2" value=" ">
```

```
  <p>Click the button to add two numbers.</p>
```

```
  <button onclick="myFunction()">add</button>
```

```
  <p><strong>Note:</strong> input only numbers</p>
```

```
  <p id="answer"></p>
```

```
<script>
    function myFunction() {
        var x = Number(document.getElementById("myNumber1").value);
        var y = Number(document.getElementById("myNumber2").value);
        var z = addition(x, y);
        document.getElementById("answer").innerHTML = z;
    }

    function addition(a, b) {
        return a + b;
    }
</script>

</body>

</html>
```

### Output:

Number 1:  Number 2:

Click the button to add two numbers.

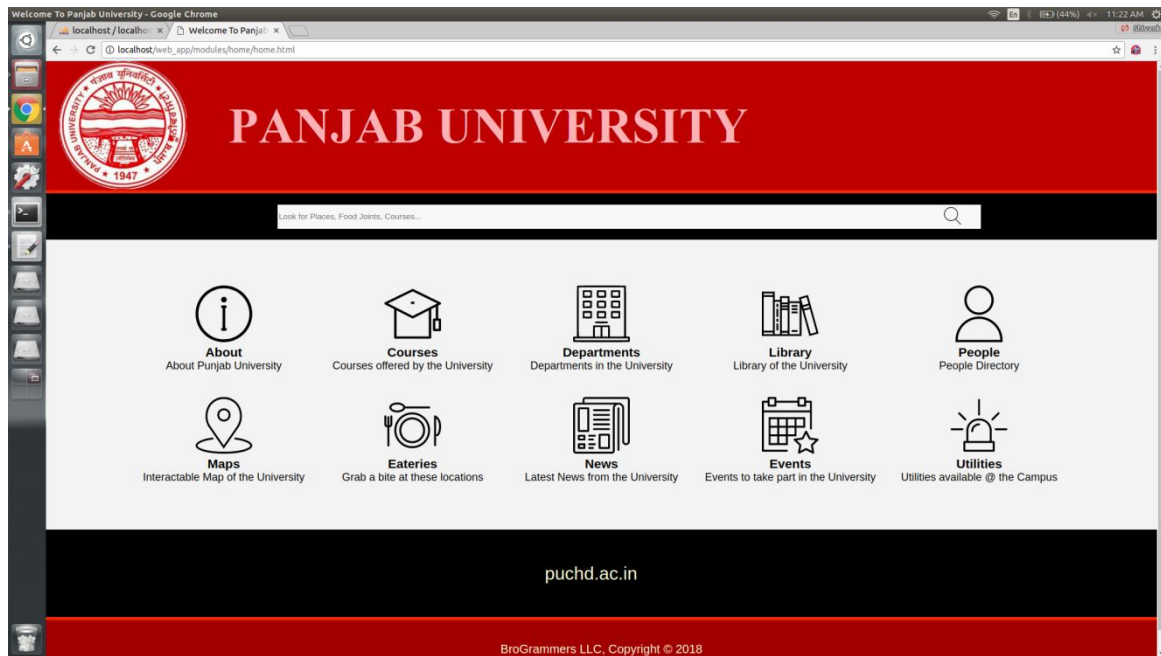

**Note:** input only numbers

गुजरी माँ

गुजरी माँ को रोने है ।।  
 पुरा है खामोश है हाँ रोने की रीति है ।।  
 मही अफस वज्रों के दुनियाँ का खंड है ।।  
 लोको बड़े लोको है अजोड़ि अजोड़ि खाना है ।।  
 मही गुजरा पावनी हरी की खंडो दुखड़ी को ।।  
 जो हलदी है पुरा का खाना है ।।  
 उकी खंड है मही गुजरी की  
 कोहे नकल गुजरी का खाना उकी खाना की ।।  
 लोको गुजरी खाना लोको है ।।  
 पुरा गुजरी के खाना पुरा गुजरी खाना है ।।  
 हाँ गुजरी है ही गुजरी अजोड़ि खाना ।।  
 पुरा है अजोड़ि खाना है अजोड़ि खाना है ।।  
 पुरा खाना है गुजरी खाना है ।।  
 लोको लोको खाना को खाना है ।।  
 जो गुजरी खाना को खाना पुरा गुजरी खाना है ।।  
 गुजरी खाना, गुजरी खाना गुजरी खाना है ।।  
 गुजरी खाना, गुजरी खाना गुजरी खाना है ।।  
 गुजरी खाना, गुजरी खाना गुजरी खाना है ।।

DEMONS RUN WHEN MEN GO TO WAR

Night will fall and drown in sun, when good men got to war,  
 True love lies and friendship dies,  
 Night will fall and dark will die, when good men go to war  
 Demons run but count the cost  
 The battle is won but the child's lost.

- Shivansh Khagwal, Mech. 2nd year

Doodle it up! participations

Achievers

1. Girls basketball team: Kritika Des (ECE second year), Tanika Ushol (IT first year), Sukhman Kaur (ECE first year), Neelankshi (EEE first year), Tavshi Chopra (BIOTECH first year), won silver medal in UUIA (Thapar University sports fest), conducted from 17th to 19th February.

2. Girls badminton team: Anshu (EEE first year), Sukriti Chawla (ECE first year), Anvi Sehgal (BIOTECH first year) won gold medal in UUIA (Thapar University sports fest), held from 17th to 19th February.

3. Omium the theatre group, won second place in IIT Guwahati.

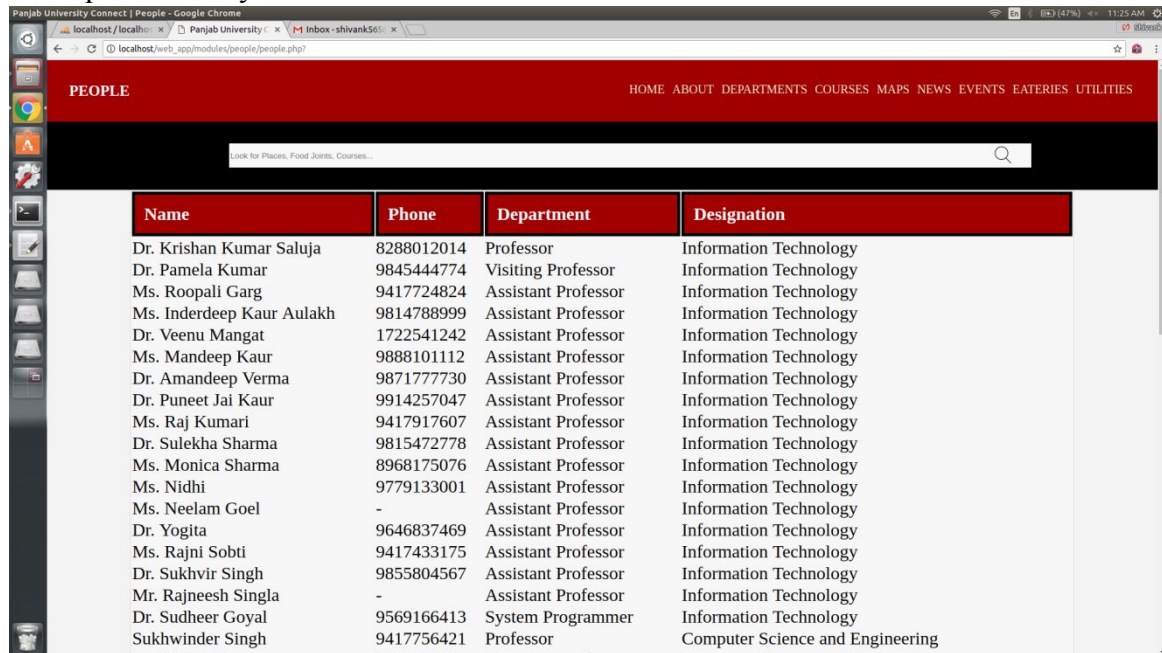

4. Divyam Madan, IT second year got selected and successfully implemented activities for GComps in season of KDE held in winters by KDE.

5. Aurobindo Debnath (IT second year), Hitesh Kumar (IT second year), Shanya Mahajan (IT third year) secured first place in HACKATHON held on 9th November 2016.

6. Charal Agarwal (IT second year), Aditya Singh (IT second year), Anushi Sharma (IT second year) secured second place in HACKATHON on 9th November 2016.
